PDX-0081.0

Summary of Conclusions

iPhone's security guarantees are predominantly enforced by the iPhone's operating system (iOS)

Evidence suggests that the App Review process does a weak job of enforcing additional security properties that cannot be enforced by the OS alone

iOS, much like macOS, is already capable of installing applications that were not distributed via Apple's App Store

If Apple allowed iPhone users to opt into third-party app distribution channels, those users would not suffer from a meaningfully less-secure experience

How is Security Enforced on iPhones?

OFF-DEVICE SECURITY
app distribution

app

Can be performed by third parties

- App Review
- Developer Identification
- Code Signing

Provides minimal (if any) security benefits relative to what iOS on-device security mechanisms provide

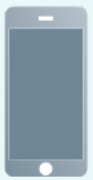
ON-DEVICE SECURITY
operating system

iOS

Independent of app distribution method

- Digital Signature Validation
- Sandboxing
- Address Space Layout Randomization (ASLR)
- Execute Never (W^X)
- Memory Isolation
- Kernel Integrity Protection
- Page Protection Layer

ON-DEVICE SECURITY
hardware



- Biometric Authentication
- Secure Enclave
- Storage Encryption
- Secure Boot

Storage Encryption

Secure Boot

On-Device Security: Operating System

ON-DEVICE SECURITY
operating system

iOS

- Digital Signature Validation
- Sandboxing
- Address Space Layout Randomization (ASLR)
- Execute Never (W^X)
- Memory Isolation
- Kernel Integrity Protection
- Page Protection Layer

Memory protection for both the kernel and apps

On-Device Security: Operating System

ON-DEVICE SECURITY
operating system

- Digital Signature Validation
- Sandboxing
- Address Space Layout Randomization (ASLR)
- Execute Never (W^X)
- Memory Isolation
- Kernel Integrity Protection
- Page Protection Layer

Isolates misbehaving processes

On-Device Security: Operating System

ON-DEVICE SECURITY
operating system

iOS

- Digital Signature Validation
- Sandboxing
- Address Space Layout Randomization (ASLR)
- Execute Never (W^X)
- Memory Isolation
- Kernel Integrity Protection
- Page Protection Layer

Examines code signatures, enabling various app distribution models

On-Device Security: Operating System

ON-DEVICE SECURITY
operating system

iOS: Models of App Distribution

App Store

iOS App Review: Security Properties

Security Properties

- Sandbox Compliance
- Exploit Resistance
- Malware Exclusion
- User Consent for Private Data
- Legal Compliance

iOS App Review: Security Properties

Security Properties

	App Review	On-Device Security: Operating System
Sandbox Compliance	✓	Sandboxing ✓
Exploit Resistance	✓	ASLR KIP W^X PPL ✓
Malware Exclusion	✓	Anti-malware scanners ✓
User Consent for Private Data	weak, at best 	System call monitoring ✓
Legal Compliance	**Difficult to ascertain by App Review or the OS**	

iOS: Models of App Distribution

App Store

Apple Developer Enterprise Program

Internal Apple Testing Distribution

iOS App Distribution Models: Security Features

iOS vs. macOS Software Layers

iOS applications

macOS applications

iOS-specific middleware

macOS-specific middleware

Middleware used by iOS and macOS

Core OS functionality shared by both OSes

Middleware used by iOS and macOS

OS kernel ("Darwin")

OS kernel ("Darwin")

Responsible for:

- Providing higher-level "friendlier" mechanisms for users and developers to communicate with hardware
- Customizing core OS-level security features

Responsible for:

- Implementing the lowest-level (*i.e.*, the most basic) management tasks like resource allocation and application scheduling
- **Enforcing core OS-level security features** (e.g., ASLR, W^X, etc.) or providing the basic framework for those features (e.g., sandboxing)

How is Security Enforced on iOS and macOS?
